1. Introduction

This webapp is to help generate workout blocks for users who want to either get into a lifting routine, or for experienced lifters who want an workout block generator and system to keep track of their progress.

1.1 Purpose

To create tailored workout plans for beginner to advanced lifters who are looking for a place to track their progression, share their results with friends, and calculate their macro nutritional needs.

<Identify the product whose software requirements are specified in this document, including the revision or release number. Describe the scope of the product that is covered by this SRS, particularly if this SRS describes only part of the system or a single subsystem.>

LiftingPal is a web application that allows for new users to get an introduction into weight lifting and then continue their progression as they get acclimated to weight lifting. LiftingPal uses a questionnaire to help create workout blocks of the user's preferred length. It takes in their injuries, weaknesses, equipment available, and frequency of workouts to figure out a good lifting plan to follow. LiftingPal is accompanied with a macronutrient calculator to help track their physical health and make sure the user is getting the proper nutrients. The web app uses a database to store each user's information and track their progression, so that when they reach the follow up questionnaire at the end of the block, they can continue their physical development. This is a type of product that results in robust workout plans and can get the user into top physical strength. LiftingPal also implements a social media aspect to encourage their progression and show case to their friends when they hit a new Personal Record (PR) max.

1.2 Scope

This subsection should:

(1) LiftingPal

(2) What the software product will do and won't do (just high level, no details):

This product will collect information from a workout enthusiast regarding their weaknesses, injuries, and equipment. After collecting this information the product will produce a workout plan specifically designed for the workout enthusiast. This product will not force the user to follow through on any of the workout plans designed for them. The choice of whether or not to follow through on any of the plans will be up to the user to decide.

(3) Describe the application of the software being specified. Describe all relevant benefits, objectives, and goals as precisely as possible:

The main benefit of this product is to allow the user to live a healthy and productive life. This product will set objectives and specific goals in terms of the workouts that are assigned to the user. The user should be able to follow the workout plans that were assigned to them, and fulfill each specific goal.

1.3 Definitions, Acronyms, and Abbreviations

Rep(s)- repetition(s)

2. General Description

The user affects the product and its requirements and is the primary source of what can affect the aforementioned items. Storing the user's data is another key factor in the creation of LiftingPal, if some bug happens to the Oracle Database holding the user's information, it may cause problems retrieving data and displaying correct results. A breach in security is another aspect that may cause future problems.

2.1 Product Perspective

There are other competing applications for Apple and Android that generate or suggest workouts for users like Fitness Point, Fitted Lifts and Jefit. These applications help make suggestions to how users should workout, while LiftingPal generates workout blocks for users and help them schedule when and how to workout. Our product goes beyond simply instructing users on how to do workouts, it helps generate workouts for the users needs while helping them stay on track by fitting into their schedule and avoiding any skips because of injuries or work obligations.

2.2 Product Functions

This product will perform functions that are related to the main questionnaire with regards to the creation of a workout plan. There will be functions that handle user input with regards to their favored workout programs, their specific level in general lifting, injuries, and weaknesses in terms of workouts. All of these specific functions deal with the user's workout plan, and furthermore there will be more functions that the software will perform for the user's social media page. The product should post the user's accomplishments on their social media page upon successful completion of a workout.

2.3 Constraints, Assumptions and Dependencies

The project assumes the user will be putting in logistical numbers relevant to how much weight the user can actually lift. There is no true benefit for the user to input values that they cannot physically achieve while working out. There are various problems that may occur within the Oracle database. The Oracle database may go through a bug or error that does not update all of the data at some point, there may be a malfunction storing the data due to any bugs that may

occur when Oracle has updates to their servers. The macronutrient calculator is an external software that is depending on the user to put reasonable height, weight, gender, and age and the percentages they are looking to adjust their caloric intake that will ultimately increase their physical health. If there is a compromise in security of the Oracle database, it will compromise the information LiftingPal stores and can change the final result of workout blocks or other prior user information.

3. Specific Requirements

This will be the largest and most important section of the SRS. The customer requirements will be embodied within Section 3.2. Overall, this section 3 will capture the requirements that are used to guide the project's software design, implementation, and testing.

3.1 External Interface Requirements

3.1.1 Software Interfaces: Oracle Database, Macronutrient calculator, Social Media interface.

3.2 Functional Requirements

This section describes specific features of the software project. If desired, some requirements may be specified in the use-case format and listed in the Use Cases Section.

3.2.1 Input of squat/bench/deadlift 1 rep maxes

Initial input of current max reps

3.2.2 Desired Program Type

Upper/Lower split

Full body

Hits a single muscle group a day

Push, Pull, Legs

3.2.3 Equipment

Any extra equipment the user might have

Ex: bench, types of bar, weights...

3.2.4 Weaknesses

What the user is weak at and would like to improve on

3.2.5 Injury checker

Any injuries that could restrict them from certain exercises

3.2.6 Follow up questionnaire

After each workout block finishes, fill out another questionnaire to update progress and capabilities

3.2.7 Lb to Kg converter

Converter for users who prefer one over the other

3.2.8 Macronutrients Calculator

Determines necessary caloric intake and macronutrient intake depending on user input and the user's age, weight, height, and sex.

3.2.9 Social Media

Will share with friends when a workout is completed or a personal record is reached

3.2.10 Desired Block Length

How long does the user want their block to be

3.2.11 Experience level

Beginner, Intermediate, Advanced Lifter selection

3.2.12 Raw vs. Equipped Lifting

Whether an advanced lifter will be using a squat suit with knee wraps, a bench shirt, and a deadlift suit and would like to improve their lifts with them.

3.2.13 Peaking Cycle

Creates a block that will shed fatigue and prepare the lifter to test their maxes in the best physical form possible

3.3 Use Cases

Use Case ID:	1.1
Use Case Name:	ORMInput and Units Used
Created By:	Team
Last Updated By:	Team
Dated Created:	September 13
Last Revision Date:	September 17
Actors:	Workout Enthusiast
Description:	Collect information on actor and base program percentages off the

	user input.
Trigger:	User starts to fill out the questionnaire.
Preconditions:	<ol style="list-style-type: none"> 1. User registers for an account. 2. User logs in account for the first time. 3. User clicks on questionnaire tab.
Postconditions:	<ol style="list-style-type: none"> 1. Stores user input. 2. Question fades. 3. User case 1.2 begins
Normal Flow:	<ol style="list-style-type: none"> 1. Use case begins when user accesses the webapp 2. User registers for an account. 3. User logs in account for the first time. 4. User clicks on questionnaire button. 5. User fills out questionnaire question 1.
Alternative Flows:	<ol style="list-style-type: none"> 4a. While the user is in the questionnaire, they leave <ol style="list-style-type: none"> 1.App closes until user returns 2.When user returns continue normal flow from step 3
Exceptions:	<ol style="list-style-type: none"> 5a. User enters number larger than 9999Lb or 9999Kg <ol style="list-style-type: none"> 1. Next button disabled, dialog box saying "Invalid input: must be less than or equal to 9999" 2. User changes number 3. User continues normal flow
Includes:	Register new User Sign in Questionnaire button pressed
Frequency of Use:	When the user first logs in, and then any time the user would like to change them (due to time off, or testing new maxes)
Special Requirements:	Requires connection to database
Assumptions:	They know answers to the question
Notes and Issues:	N/A

3.5 Non-Functional Requirements

Non-functional requirements may exist for the following attributes. Often these requirements must be achieved at a system-wide level rather than at a unit level. State the requirements in the following sections in measurable terms (e.g., 95% of transaction shall be processed in less than a second, system downtime may not exceed 1 minute per day, > 30 day MTBF value, etc).

3.5.1 Dictionary for Terms Used/Explanations:

The product will return a dictionary that has explanations regarding the specific terms related to workouts for users who are not aware of these respective terms. The dictionary with all of the relevant terms/explanations should be returned to the user under five seconds. This feature is something that should be entirely reliable for the user. The user should have readily available access to this feature. The security related to this feature is guaranteed via the same security that the product itself. This dictionary will automatically be maintained and have all the necessary terms preloaded. This feature will be portable as well in accordance to the portability of the product itself.

3.5.2 Memorization of User Input: This is an integral part of the product which involves the memorization of user input to perform specific tasks related to workout plans, or other particular features. This is a task that should be able to be processed under five seconds in a quick and

efficient manner. This is a feature that is reliable as it is integral for the product to function. This feature will become available whenever there is an instance of user input. Security is essentially guaranteed via the product itself. This requirement will be maintained at every instance of user input as it is important for the product to function. This feature will support portability as it is a feature of the product which itself is portable.

3.5.3 Categorization of Users: This product is dependent on the lifting ability and general strength of the users themselves. At the very minimum the user must be able to physically move a barbell. The product will maintain this general information about the user to determine whether or not they are physically able to use this product for their workouts. The product will be able to maintain and process this data under five seconds. As this is another important feature for the product and user safety it will be reliable at all times. This is a feature that will be available initially as it will be required for the user to enter this information. Once the information has been processed, and the user is acceptable then the product can move forward. This feature will remain secure as it has access to the security of the product itself. This feature will be maintained whenever this feature is in use. This feature has access to portability by extension of the main product's portability.

3.5.4 Documentation behind Lifter Types: There will be extensive documentation behind each lifter type. This is a feature that will be fast and will be processed under five seconds. This feature will remain available when it is in use. It is a feature that will have security access by extension of the product itself. There will be no further security processes for this feature of the product. This feature will be maintained during its usage within the product. Portability is available by extension of the main product's portability.

3.5.5 Time taken to generate Program: This non-functional feature is about the total amount of time that will be required to generate this program. The general time to generate this program will be under five seconds. This performance will be reliable and replicable unless there is a specific error within the program itself. This will be an available feature as it will be encountered during every execution and build of the program. There will be no further implementation of security for this case. There will be no maintainability for this case unless the product spends more than the regular amount of time to generate the program. This is portability as the product is meant to be a portable product.

3.5.6 Security of the product: This is the non-functional feature that is related to the security of the product itself. This means that the product will implement a level of security to make sure that user data such as names, weights, and types of workouts, and other records will be safe. The security itself will be guaranteed via user accounts that the user must create to access their own data. The performance of the security will be under five seconds, and will stay a reliable feature of the product as securing user data is very important. This feature will be available by default once the user has logged into the product. The user's account will be the security which holds the data of each respective user. Security will be maintained during each run of the

program. This will be a portable feature as security must be maintained via logins regardless of platform.

3.5.7 Oracle Database: Oracle Database will be utilized in this product to store data with regards to the user. This feature must remain fast and efficient and should be able to be processed under five seconds. This is a reliable process as it is a third-party application that is known to be trustworthy and reliable. Security is already granted via the security of the product itself (user login). There will be no further security implementations for the database aside from the user's login. There will be no reason to maintain this feature. It will be used when the need specifically arises during the run of the program. This will be a portable feature as we must have a database to run integral parts of the program regardless of the platform.

3.5.8 System Checks/Updates: The system must check and update the server every time it is opened, and the device is connected to the internet. The requirement's performance will be processed in under five seconds. This will be a reliable feature as the system must update every time it is opened unless there is some error within the process. This feature will be available whenever the device itself is connected to the internet, and whenever the system itself is opened. There will be no further implementation of security for this feature aside from the user's login. This process will be maintained every time this feature is in use. This will be a portable feature as it regardless of the platform there must be a constant update whenever the program is opened, or whenever the device itself is connected to the internet.

3.6 Logical Database Requirements

We will run a MySQL Relational Database that will store information on users that will be used to generate their workout block. We will keep the tables to a minimum, we will have three tables. The first will store usernames, passwords and friends, the second will contain the equipment that each user has access to, and the third will contain Personal Records, their current maxes for different workouts and benchmarks they reached in previous block.

3.7 Other Requirements

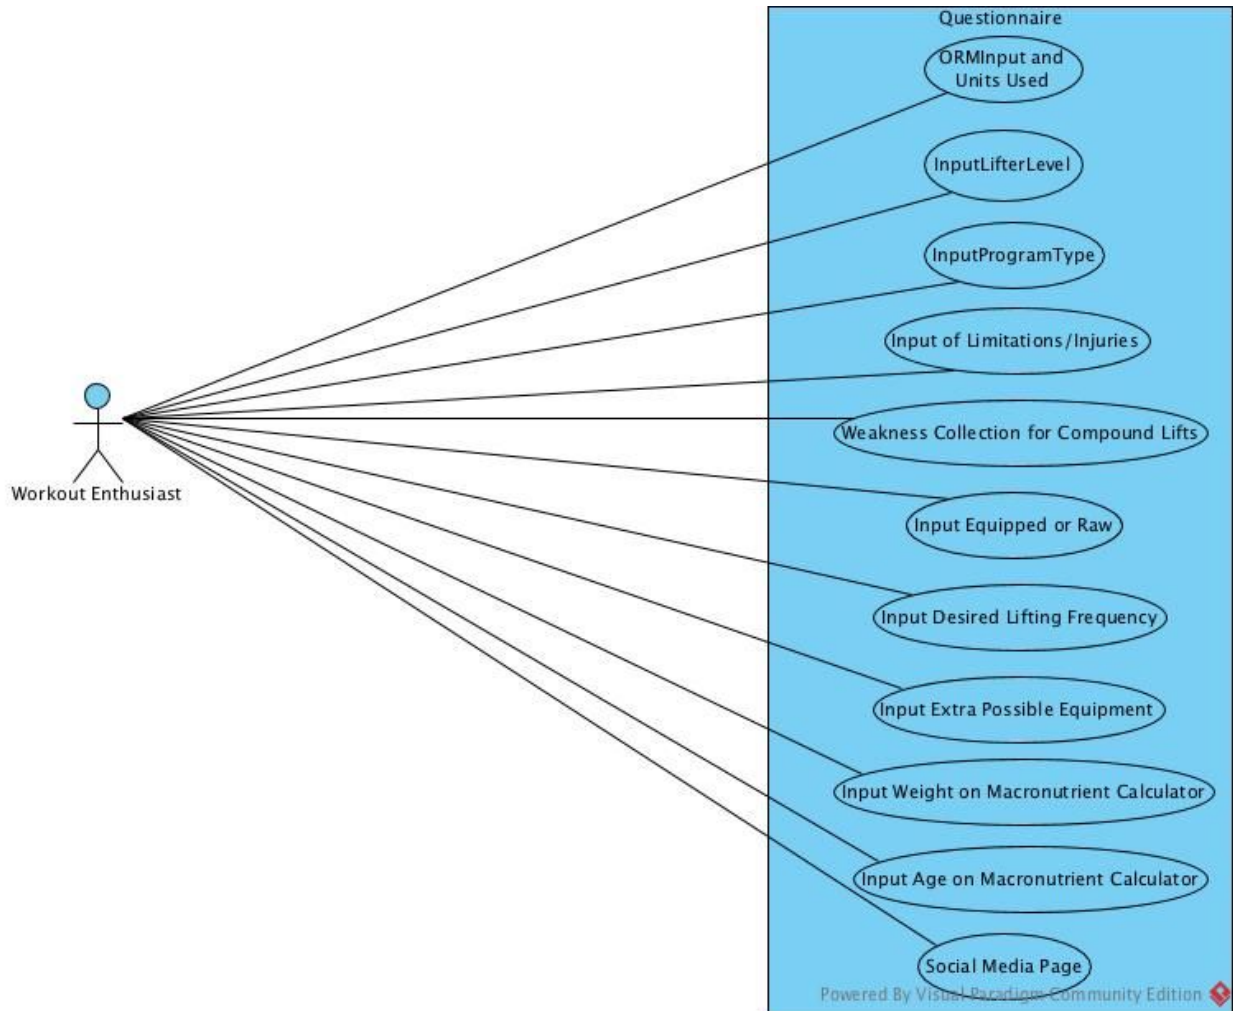

Catchall section for any additional requirements.

4. Analysis Models

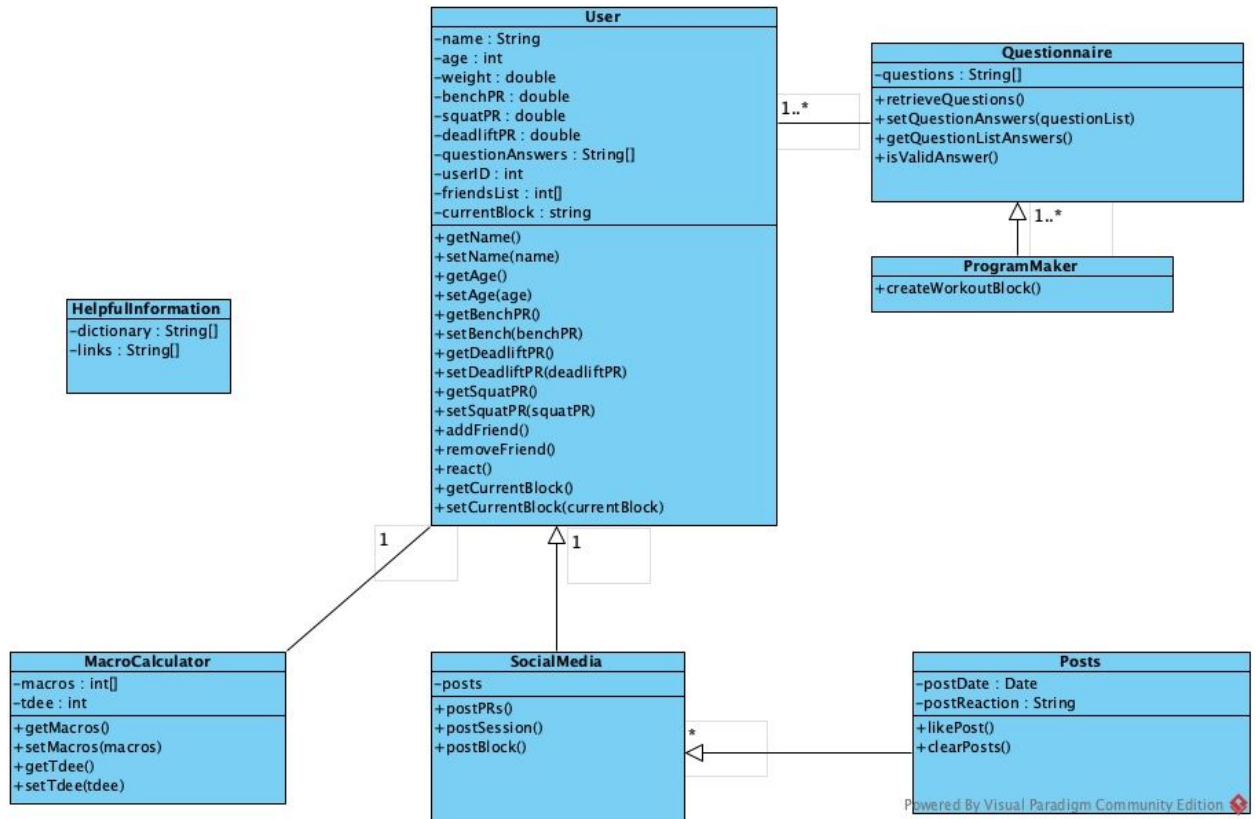

List all analysis models used in developing specific requirements previously given in this SRS. Each model should include an introduction and a narrative description. Furthermore, each model should be traceable to the SRS's requirements.

4.1 Use Case Diagrams

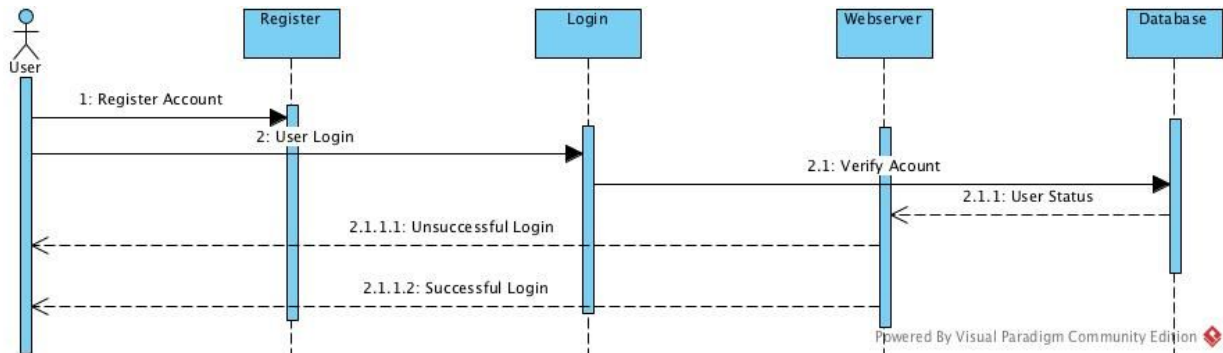

4.2 Class Diagrams

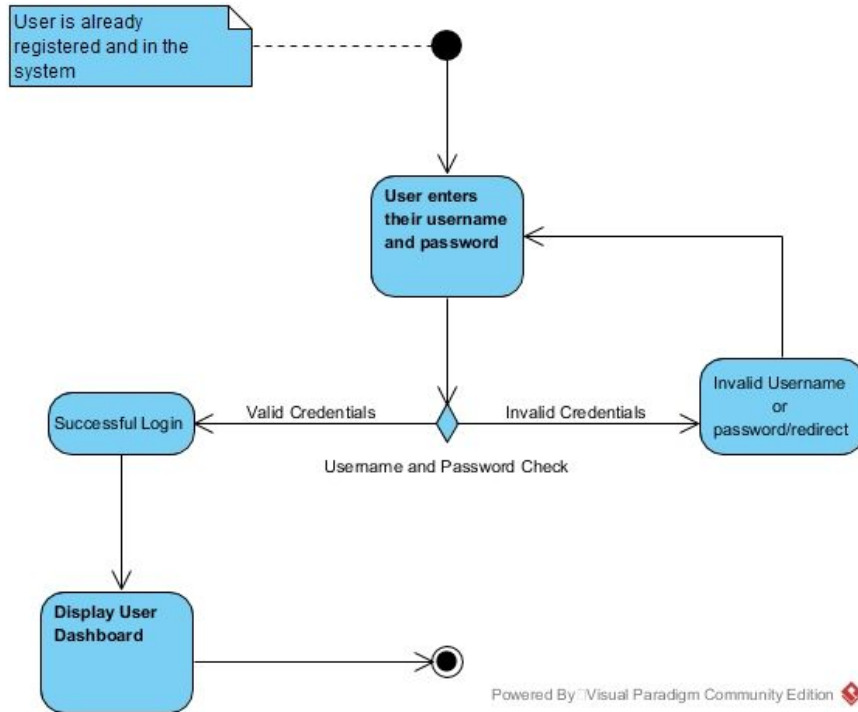

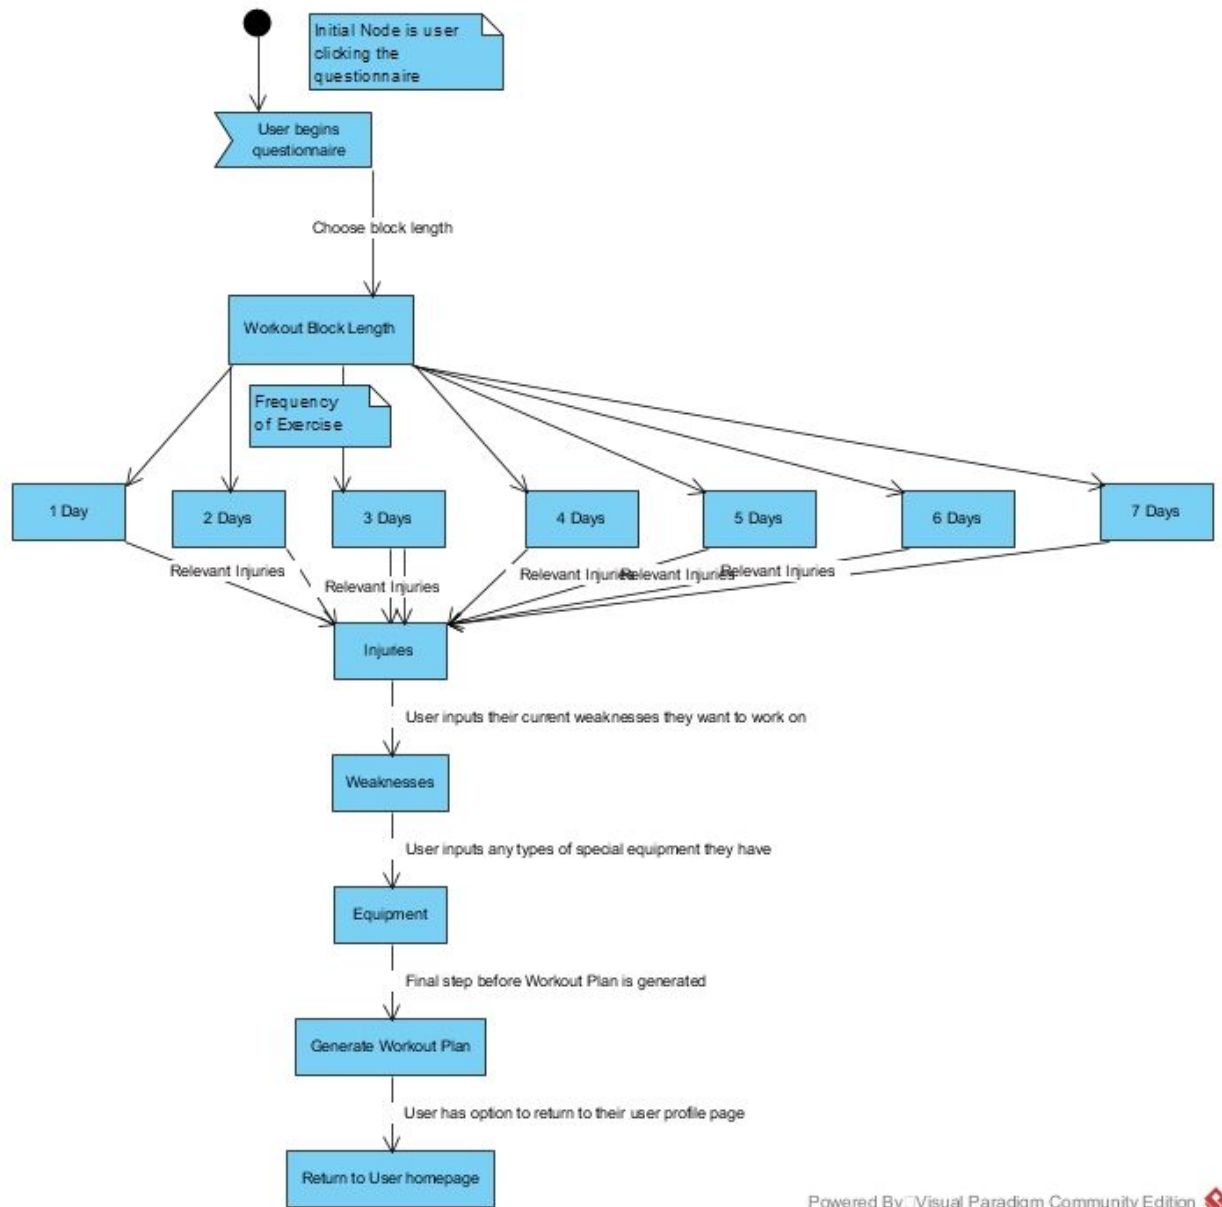

4.3 Sequence Diagrams

4.4 Activity Diagrams

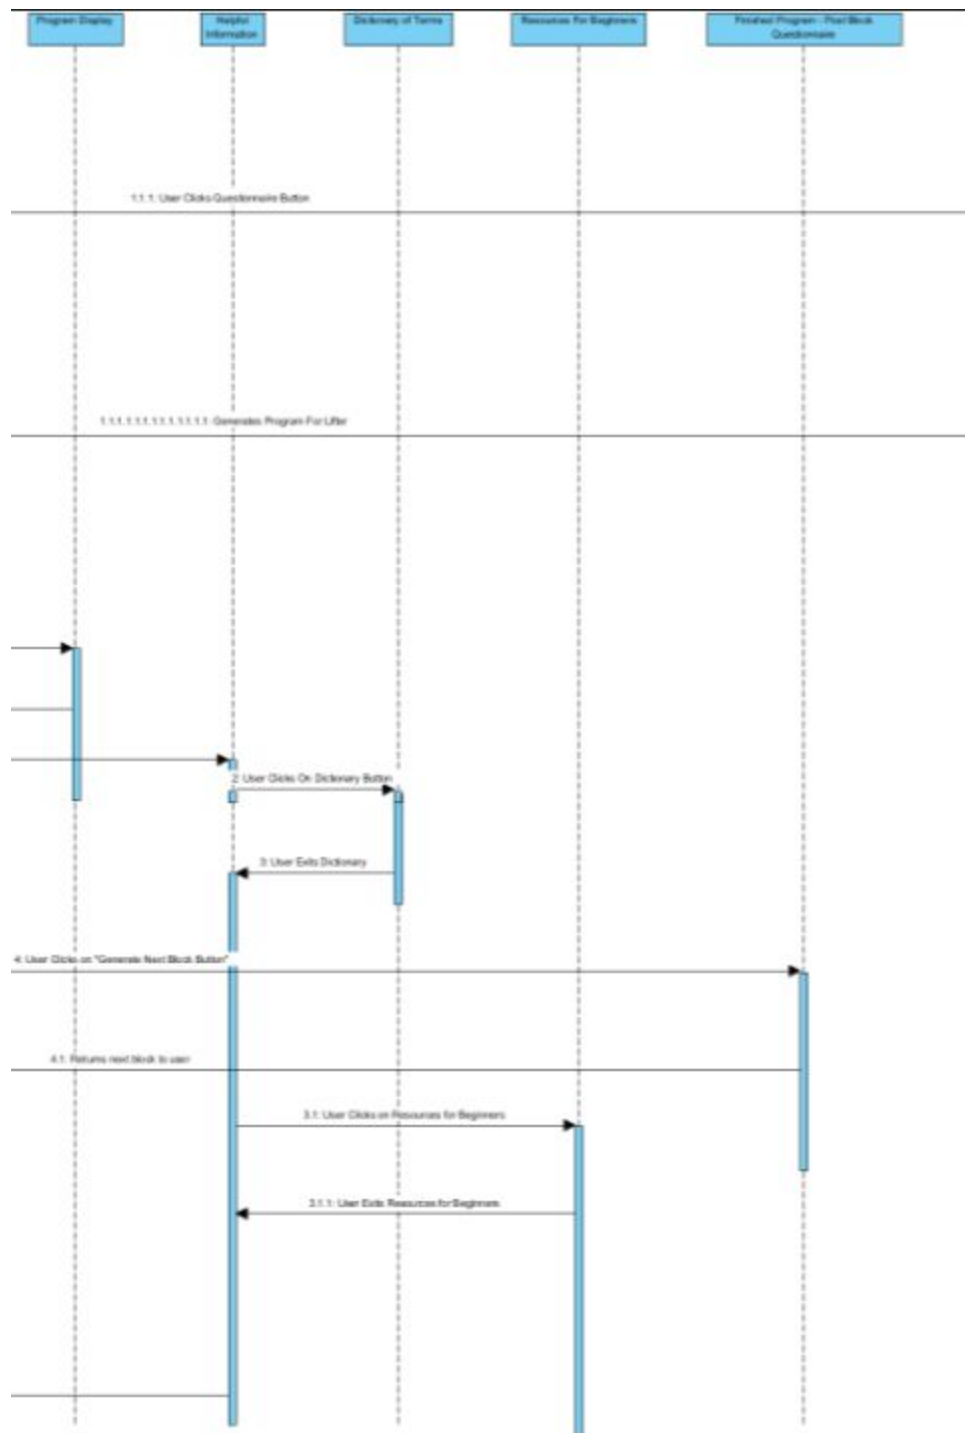

4.5 State-Transition Diagrams (STD)

```

sequenceDiagram
    participant User
    participant Equipment
    participant FindObjectsLinks as Find Objects and Links
    participant InputUserLink as Input User Link
    participant InputProgramType as Input Program Type
    participant InputLocationsNumber as Input of Locations/Number
    participant SelectionsCollection as Selections Collection for Component Life
    participant InputEquipment as Input Equipment or Reservation to be reserved (When make file selected)
    participant InputDesiredLinkFrequency as Input Desired Link Frequency
    participant InputPossibleExtraEquipment as Input Possible Extra Equipment

with any one of the team members to consider a change in the program. After receiving the proposed changes, the group will need to discuss the changes and reach a consensus to apply the changes. Otherwise the recommendation for a particular change will be discarded.

A. Appendices

Appendices may be used to provide additional (and hopefully helpful) information. If present, the SRS should explicitly state whether the information contained within an appendix is to be considered as a part of the SRS's overall set of requirements.

Example Appendices could include (initial) conceptual documents for the software project, marketing materials, minutes of meetings with the customer(s), etc.
